1. Problem 4.3 # 9

- (a) Let assumptions be as in the problem statement. We know that $A = \{a \in R \mid \phi(a) \in A'\}$. Consider $a_1, a_2 \in A$, then we know that $\phi(a_1), \phi(a_2) \in A'$. Since A' is a subring of R' we know that $\phi(a_1) + \phi(a_2) \in A'$. Similarly, since ϕ is a ring homomorphism, we know that $\phi(a_1) + \phi(a_2) = \phi(a_1 + a_2)$. Likewise, since A' is a ring, we know that $\phi(a_2) + \phi(a_1) \in A'$ and it is simple to show that $a_2 + a_1 \in A$ and it would follow that $\phi(a_1 + a_2) = \phi(a_1) + \phi(a_2) = \phi(a_2) + \phi(a_1) = \phi(a_2 + a_1)$ and we then know that $a_1 + a_2 = a_2 + a_1$. Since we know that $\phi(a_1) + \phi(a_2) = \phi(a_1 + a_2)$, we know $\phi(a_1 + a_2) \in A'$; therefore, by the definition of the set A we have that $a_1 + a_2 \in A$. Similarly, since ϕ is a ring homomorphism, we know that $\phi(a_1 a_2) = \phi(a_1) \phi(a_2)$. Since $\phi(a_1), \phi(a_2) \in A'$, we also know that $\phi(a_1 a_2) \in A'$ and by the definition of A we know that $a_1 a_2 \in A$. Therefore, since for elements $a_1, a_2 \in A$ we know that $a_1 + a_2 = a_2 + a_1 \in A$ and $a_1 a_2 \in A$, then A is a subring of R . Now if we take $k \in K$, since K is the kernel of ring homomorphism ϕ then it implies that $\phi(k) = 0$ but since A' is a subring of R' therefore, $0 \in A'$. Therefore, since $\phi(k) \in A'$ and from the definition of A we have that $k \in A$, we know that $K \subset A$.
- (b) Let assumptions be as in the problem statement. We can define a new function $\phi_A : A \rightarrow R'$ which is a ring homomorphism since it is just a restriction of a ring homomorphism to a subring of R . We define that for any $a \in A$ we have that $\phi_A(a) = \phi(a)$. The kernel of ϕ_A is K since $K \subset A$. We know that $\phi_A(a) = \phi(a) \in A'$ which implies that the image of $\phi_A \subset A'$. We also know that for any $a' \in A'$ that there exists an $a \in A$, such that $\phi(a) = \phi_A(a) = a' \in \text{Im} \phi_A$. This then implies that $A' \subset \text{Im} \phi_A$. Therefore, $\text{Im} \phi_A = A'$. Then by the First Homomorphism Theorem, we know that $A/K \simeq A'$.
- (c) Let assumptions be as in the problem statement. We are given that A' is a left ideal of R' , which tells us that for $r' \in R', a' \in A'$. We want to show that for $r \in R, a \in A$ that $ra \in A$. Since $a \in A$, then we know that $\phi(a) \in A'$. If we take $\phi(ra) = \phi(r)\phi(a)$ since ϕ is a homomorphism. Since A' is a left ideal we know that $\phi(r)\phi(a) \in A'$. Therefore, by the definition of A we know that $ra \in A$. Therefore, A is a left ideal of R .

2. Problem 4.3 # 18

Let assumptions be as in the problem statement. In order to show that $R \oplus S$ is a ring we need to show that for elements $a, b \in R \oplus S$ that $ab, a + b, a + (-b) \in R \oplus S$. Since R, S are rings by definition, we know that elements $r + t, r + (-t), rt \in R$ and that $s + u, s + (-u), su \in S$. Then if we define $a = (r, s), b = (t, u) \in R \oplus S$ we know that $a + b, a + (-b), ab \in R \oplus S$. Therefore, we know that $R \oplus S$ is a ring. Next we will show that the subring $\{(r, 0) | r \in R\}$ is an ideal of $R \oplus S$. Since we are given that this is a subring of $R \oplus S$ we know that it is an additive subgroup. We then need to show that this subring absorbs multiplication on the left and right. Let us define $(a, 0), (b, 0) \in R \oplus S$ and $a, b \in R$. We know that $ab, ba \in R$ since R is a ring. This means that $(a, 0)(b, 0) = (ab, 0) \in \{(r, 0) | r \in R\}$ and $(b, 0)(a, 0) = (ba, 0) \in \{(r, 0) | r \in R\}$. We then want to show that this ideal is isomorphic to R . We can show this if we can develop an isomorphism $\phi : \{(r, 0) | r \in R\} \rightarrow R$. We will define $\phi : \{(r, 0) | r \in R\} \rightarrow R$ as for $a \in \{(r, 0) | r \in R\}$ where $a = (r, 0)$ that $\phi(a) = \phi((r, 0)) = r \in R$. Let $a = (r, 0), b = (t, 0) \in \{(r, 0) | r \in R\}$, we know that $rt \in R$ by definition, then we can show $\phi(a) + \phi(b) = r + t = \phi(a + b)$ and $\phi(a)\phi(b) = rt = \phi(ab)$. This showed that ϕ is a homomorphism. Then we have that if $\phi(a) = \phi(b)$ we know that $r = t$ which implies that $a = (r, 0) = (t, 0) = b$ which shows that ϕ is one to one and an monomorphism. Lastly we want to check to see if ϕ is onto. Then for $r \in R$ we know that $(r, 0) \in \{(r, 0) | r \in R\}$ would map as $\phi((r, 0)) = r \in R$. This applies the exact same to $\{(0, s) | s \in S\}$ without loss of generality.

3. Problem 4.3 # 19

- (a) Let assumptions be as in the problem statement. In order to prove that R is a ring we want to show that for $a_1, a_2 \in R$ that $ab, a + b, a + (-b) \in R$. Let $a_1 = \begin{pmatrix} a_1 & b_1 \\ 0 & c_1 \end{pmatrix}$, $a_2 = \begin{pmatrix} a_2 & b_2 \\ 0 & c_2 \end{pmatrix} \in R$. Then it is simple to see that $a_1 a_2 = \begin{pmatrix} a_1 a_2 & a_1 b_2 + b_1 c_2 \\ 0 & c_1 c_2 \end{pmatrix}$ then $a_1 a_2 \in R$. Similarly, $a_1 + a_2 = \begin{pmatrix} a_1 + a_2 & b_1 + b_2 \\ 0 & c_1 + c_2 \end{pmatrix} \in R$, and $a_1 + (-a_2) = \begin{pmatrix} a_1 - a_2 & b_1 - b_2 \\ 0 & c_1 - c_2 \end{pmatrix} \in R$. Since $a_1 a_2, a_1 + a_2, a_1 + (-a_2) \in R$ we know that R is a ring.
- (b) Let assumptions be as in the problem statement. In order to show that I is an ideal of R we need to show that I is an additive subgroup of R and absorbs multiplication from the right and left. Since R and subsequently I follows normal matrix addition properties we know that for any if for any $i_1 = \begin{pmatrix} 0 & a_1 \\ 0 & 0 \end{pmatrix}$, $i_2 = \begin{pmatrix} 0 & a_2 \\ 0 & 0 \end{pmatrix} \in I$ we know that $i_1 + i_2 = \begin{pmatrix} 0 & a_1 + a_2 \\ 0 & 0 \end{pmatrix} \in I$. Therefore, we know that I is an additive subgroup of R . Then we want to show that I absorbs multiplication on the left and right. Consider the same $i_1, i_2 \in I$ as before. Then it is simple to see that $i_1 i_2 = \begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix}$ and $i_2 i_1 = \begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix}$. And since $0 \in \mathbb{R}$, then $i_1 i_2, i_2 i_1 \in I$. This implies that I absorbs multiplication on the left and the right and is therefore an ideal of R .
- (c) Let assumptions be as in the problem statement. In order to show these are isomorphic we will define a mapping $\phi : R/I \rightarrow F \oplus F$ as $\phi\left(\begin{pmatrix} a & b \\ 0 & c \end{pmatrix}\right) = (a, c)$. Let us define $A = \begin{pmatrix} a_1 & b_1 \\ 0 & c_1 \end{pmatrix}$, $B = \begin{pmatrix} a_2 & b_2 \\ 0 & c_2 \end{pmatrix} \in R$. We are able to define A and B simply like this because the definition of $R/I = \{a + I | a \in R\}$ does not affect elements a_1, c_1 . Then we have that $A + B = \begin{pmatrix} a_1 + a_2 & b_1 + b_2 \\ 0 & c_1 + c_2 \end{pmatrix}$ and $\phi(A + B) = (a_1 + a_2, c_1 + c_2) = (a_1, c_1) + (a_2, c_2) = \phi(A) + \phi(B)$ therefore, we know that ϕ is a homomorphism. We then want to show that ϕ is one to one, Let us say that $\phi(A) = \phi(B)$, that is to say that $(a_1, c_1) = (a_2, c_2)$. This implies then that $a_1 = a_2, c_1 = c_2$. Then it would follow that $A = B$. This means that ϕ is one to one and is therefore a monomorphism. Lastly, we want to show that ϕ is onto. Let us define an element of $F \oplus F$ as (a, c) , then the element of R/I that corresponds to (a, c) is $\begin{pmatrix} a & b \\ 0 & c \end{pmatrix}$. This implies that ϕ is onto and is therefore an isomorphism. Therefore, since we have an isomorphism $\phi : R/I \rightarrow F \oplus F$ we know that $R/I \simeq F \oplus F$.

4. Problem 4.3 # 20

Let assumptions be as in the problem statement. Then for all $r_1, r_2 \in R$, we know that $\phi(r_1 + r_2) = (r_1 + r_2 + I, r_1 + r_2 + J) = ((r_1 + I) + (r_2 + I), (r_1 + J) + (r_2 + J)) = (r_1 + I, r_1 + J) + (r_2 + I, r_2 + J) = \phi(r_1) + \phi(r_2)$. This is true since I, J are ideals. Then we also know that $\phi(r_1 r_2) = (r_1 r_2 + I, r_1 r_2 + J) = ((r_1 + I)(r_2 + I), (r_1 + J)(r_2 + J)) = (r_1 + I, r_1 + J)(r_2 + I, r_2 + J) = \phi(r_1)\phi(r_2)$. Therefore, we know that ϕ is a homomorphism. Then $\text{Ker } \phi = \{r \in R \mid \phi(r) = (I, J)\} = \{r \in R \mid (r + I, r + J) = (I, J)\} = \{r \in R \mid r + I = I, r + J = J\} = \{r \in R \mid r \in I, r \in J\} = \{r \in R \mid r \in I \cap J\} = I \cap J$.

5. Problem 4.3 # 21.

Let assumptions be as in the problem statement. We have to show that $\mathbb{Z}_{15} \simeq \mathbb{Z}_3 \oplus \mathbb{Z}_5$. We know that \mathbb{Z}_{15} and $\mathbb{Z}_3 \oplus \mathbb{Z}_5$ are cyclic groups and since $\gcd(3, 5) = 1$ we know that they are isomorphic since there is a unique cyclic group of given order up to isomorphism.
